Though there are subtle **differences** in how they work- these methods can be used to set the `this` value of a function.

swipe for detailed examples

JS

bind

It **returns** a new function with the **`this`** value set instead of invoking the function immediately.

You can **execute** the function **later** where the **`this`** is forced to take the value of the object that you called with **bind**.

```
function welcome() {
  console.log(`Welcome, ${this.name}!`);
}

const sloba = { name: 'Sloba' };

const welcomeSloba = welcome.bind(sloba);
welcomeSloba(); // Welcome, Sloba!
```

creates a new function with its `this` set

function executed later

Swipe →

JS

call

Execute a function immediately- the **first parameter** is the **object** that is set as `this`. All the arguments after it will be passed to the function.

```
function welcome(firstName, lastName) {
  console.log(`Welcome, ${this.name}!
Nice meeting you ${firstName}
${lastName}`);
}

const sloba = { name: 'Sloba' };

welcome.call(sloba, 'Mary', 'Watson');
```

executes the function with `this` and passes parameters

Swipe →

JS

apply

Same as **call** but the second parameter is an **array** whose items will **each** be passed to the function as **arguments**.

```
function welcome(firstName, lastName) {
  console.log(`Welcome, ${this.name}! Nice
meeting you ${firstName} ${lastName}`);
}

const sloba = { name: 'Sloba' };

welcome.apply(sloba, ['Mary', 'Watson']);
```

executes the function with `this` and passes array as parameters
